ABSTRACT

The object of this paper is first,to evaluate a general multiple Eulerian integrals with general integrands involving the product of a multivariable Aleph-function , a general class of polynomials, the Aleph-function of one variable and generalized hypergeometric function with general arguments. The second multiple Eulerian integral contain a general class of polynomials, the general polynomial set, the Aleph- function of one variable and multivariable Aleph-function with general arguments. Our integral formulas are interesting and unified nature.

1. Introduction

In this paper, we evaluate two multiple Eulerian integrals involving the multivariable Aleph-function , the Aleph-function of one variable and multivariable class of polynomials with general arguments.

The Aleph-function of several variables generalize the multivariable I-function defined by Sharma and Ahmad [6] , itself is an a generalisation of G and H-functions of several variables. The multiple Mellin-Barnes integral occuring in this paper will be referred to as the multivariables Aleph-function throughout our present study and will be defined and represented as follows.

We have : $\aleph(z_1, \cdots, z_r) = \aleph^{0,\mathfrak{n}:m_1,n_1,\cdots,m_r,n_r}_{p_i,q_i,\tau_i;R:p_{i(1)},q_{i(1)},\tau_{i(1)};R^{(1)};\cdots;p_{i(r)},q_{i(r)};\tau_{i(r)};R^{(r)}} \left(\begin{array}{c} z_1 \\ \cdot \\ \cdot \\ \cdot \\ z_r \end{array} \right|$

$[(a_j; \alpha_j^{(1)}, \cdots, \alpha_j^{(r)})_{1,\mathfrak{n}}] \quad ,[\tau_i(a_{ji}; \alpha_{ji}^{(1)}, \cdots, \alpha_{ji}^{(r)})_{\mathfrak{n}+1,p_i}] :$
$\cdots\cdots\cdots\cdots\cdots\cdots\cdots\cdots \quad ,[\tau_i(b_{ji}; \beta_{ji}^{(1)}, \cdots, \beta_{ji}^{(r)})_{m+1,q_i}] :$

$[(c_j^{(1)}), \gamma_j^{(1)})_{1,n_1}], [\tau_{i(1)}(c_{ji(1)}^{(1)}, \gamma_{ji(1)}^{(1)})_{n_1+1,p_i^{(1)}}]; \cdots ; \; [(c_j^{(r)}), \gamma_j^{(r)})_{1,n_r}], [\tau_{i(r)}(c_{ji(r)}^{(r)}, \gamma_{ji(r)}^{(r)})_{n_r+1,p_i^{(r)}}]$
$[(d_j^{(1)}), \delta_j'^{(1)})_{1,m_1}], [\tau_{i(1)}(d_{ji(1)}^{(1)}, \delta_{ji(1)}^{(1)})_{m_1+1,q_i^{(1)}}]; \cdots ;; [(d_j^{(r)}), \delta_j'^{(r)})_{1,m_r}], [\tau_{i(r)}(d_{ji(r)}^{(r)}, \delta_{ji(r)}^{(r)})_{m_r+1,q_i^{(r)}}] \bigg)$

$$= \frac{1}{(2\pi\omega)^r} \int_{L_1} \cdots \int_{L_r} \psi(s_1, \cdots, s_r) \prod_{k=1}^{r} \theta_k(s_k) z_k^{s_k} \, \mathrm{d}s_1 \cdots \mathrm{d}s_r \qquad (1.1)$$

with $\omega = \sqrt{-1}$

$$\psi(s_1, \cdots, s_r) = \frac{\prod_{j=1}^{\mathfrak{n}} \Gamma(1 - a_j + \sum_{k=1}^{r} \alpha_j^{(k)} s_k)}{\sum_{i=1}^{R} [\tau_i \prod_{j=\mathfrak{n}+1}^{p_i} \Gamma(a_{ji} - \sum_{k=1}^{r} \alpha_{ji}^{(k)} s_k) \prod_{j=1}^{q_i} \Gamma(1 - b_{ji} + \sum_{k=1}^{r} \beta_{ji}^{(k)} s_k)]} \qquad (1.2)$$

and $\theta_k(s_k) = $

$$\theta_k(s_k) = \frac{\prod_{j=1}^{m_k} \Gamma(d_j^{(k)} - \delta_j'^{(k)} s_k) \prod_{j=1}^{n_k} \Gamma(1 - c_j^{(k)} + \gamma_j^{(k)} s_k)}{\sum_{i^{(k)}=1}^{R^{(k)}} [\tau_{i^{(k)}} \prod_{j=m_k+1}^{q_{i^{(k)}}} \Gamma(1 - d_{ji^{(k)}}^{(k)} + \delta_{ji^{(k)}}^{(k)} s_k) \prod_{j=n_k+1}^{p_{i^{(k)}}} \Gamma(c_{ji^{(k)}}^{(k)} - \gamma_{ji^{(k)}}^{(k)} s_k)]} \quad (1.3)$$

Suppose , as usual , that the parameters

$a_j, j = 1, \cdots, p; b_j, j = 1, \cdots, q;$

$c_j^{(k)}, j = 1, \cdots, n_k; c_{ji^{(k)}}^{(k)}, j = n_k + 1, \cdots, p_{i^{(k)}};$

$d_j^{(k)}, j = 1, \cdots, m_k; d_{ji^{(k)}}^{(k)}, j = m_k + 1, \cdots, q_{i^{(k)}};$

with $k = 1 \cdots, r, i = 1, \cdots, R, i^{(k)} = 1, \cdots, R^{(k)}$

are complex numbers , and the $\alpha's, \beta's, \gamma's$ and $\delta's$ are assumed to be positive real numbers for standardization purpose such that

$$U_i^{(k)} = \sum_{j=1}^{n} \alpha_j^{(k)} + \tau_i \sum_{j=n+1}^{p_i} \alpha_{ji}^{(k)} + \sum_{j=1}^{n_k} \gamma_j^{(k)} + \tau_{i^{(k)}} \sum_{j=n_k+1}^{p_{i^{(k)}}} \gamma_{ji^{(k)}}^{(k)} - \tau_i \sum_{j=1}^{q_i} \beta_{ji}^{(k)} - \sum_{j=1}^{m_k} \delta_j'^{(k)}$$

$$- \tau_{i^{(k)}} \sum_{j=m_k+1}^{q_{i^{(k)}}} \delta_{ji^{(k)}}^{(k)} \leqslant 0 \quad (1.4)$$

The reals numbers τ_i are positives for $i = 1$ to R , $\tau_{i^{(k)}}$ are positives for $i^{(k)} = 1$ to $R^{(k)}$

The contour L_k is in the s_k-p lane and run from $\sigma - i\infty$ to $\sigma + i\infty$ where σ is a real number with loop , if necessary ,ensure that the poles of $\Gamma(d_j^{(k)} - \delta_j'^{(k)} s_k)$ with $j = 1$ to m_k are separated from those of $\Gamma(1 - a_j + \sum_{i=1}^{r} \alpha_j^{(k)} s_k)$ with $j = 1$ to n and $\Gamma(1 - c_j^{(k)} + \gamma_j^{(k)} s_k)$ with $j = 1$ to n_k to the left of the contour L_k . The condition for absolute convergence of multiple Mellin-Barnes type contour (1.9) can be obtained by extension of the corresponding conditions for multivariable H-function given by as :

$|argz_k| < \frac{1}{2} A_i^{(k)} \pi$, where

$$A_i^{(k)} = \sum_{j=1}^{n} \alpha_j^{(k)} - \tau_i \sum_{j=n+1}^{p_i} \alpha_{ji}^{(k)} - \tau_i \sum_{j=1}^{q_i} \beta_{ji}^{(k)} + \sum_{j=1}^{n_k} \gamma_j^{(k)} - \tau_{i^{(k)}} \sum_{j=n_k+1}^{p_{i^{(k)}}} \gamma_{ji^{(k)}}^{(k)}$$

$$+ \sum_{j=1}^{m_k} \delta_j'^{(k)} - \tau_{i^{(k)}} \sum_{j=m_k+1}^{q_{i^{(k)}}} \delta_{ji^{(k)}}^{(k)} > 0, \quad \text{with } k = 1 \cdots, r, i = 1, \cdots, R, i^{(k)} = 1, \cdots, R^{(k)} \quad (1.5)$$

The complex numbers z_i are not zero.Throughout this document , we assume the existence and absolute convergence conditions of the multivariable Aleph-function.

We may establish the the asymptotic expansion in the following convenient form :

$\aleph(y_1, \cdots, y_r) = 0(|y_1|^{\alpha_1}, \cdots, |y_r|^{\alpha_r}), max(|y_1|, \cdots, |y_r|) \to 0$

$\aleph(y_1, \cdots, y_r) = 0(|y_1|^{\beta_1}, \cdots, |y_r|^{\beta_r}), min(|y_1|, \cdots, |y_r|) \to \infty$

where $k = 1, \cdots, r : \alpha_k = min[Re(d_j^{(k)}/\delta_j'^{(k)})], j = 1, \cdots, m_k$ and

$$\beta_k = max[Re((c_j^{(k)} - 1)/\gamma_j^{(k)})], j = 1, \cdots, n_k$$

We will use these following notations in this paper

$$U = p_i, q_i, \tau_i; R \ ; \ V = m_1, n_1; \cdots; m_r, n_r \tag{1.6}$$

$$\mathsf{W} = p_{i^{(1)}}, q_{i^{(1)}}, \tau_{i^{(1)}}; R^{(1)}, \cdots, p_{i^{(r)}}, q_{i^{(r)}}, \tau_{i^{(r)}}; R^{(r)} \tag{1.7}$$

$$A = \{(a_j; \alpha_j^{(1)}, \cdots, \alpha_j^{(r)})_{1,n}\}, \{\tau_i(a_{ji}; \alpha_{ji}^{(1)}, \cdots, \alpha_{ji}^{(r)})_{n+1,p_i}\} \tag{1.8}$$

$$B = \{\tau_i(b_{ji}; \beta_{ji}^{(1)}, \cdots, \beta_{ji}^{(r)})_{m+1,q_i}\} \tag{1.9}$$

$$C = \{(c_j^{(1)}; \gamma_j^{(1)})_{1,n_1}\}, \tau_{i^{(1)}}(c_{ji^{(1)}}^{(1)}; \gamma_{ji^{(1)}}^{(1)})_{n_1+1,p_{i^{(1)}}}\}, \cdots, \{(c_j^{(r)}; \gamma_j^{(r)})_{1,n_r}\}, \tau_{i^{(r)}}(c_{ji^{(r)}}^{(r)}; \gamma_{ji^{(r)}}^{(r)})_{n_r+1,p_{i^{(r)}}}\} \tag{1.10}$$

$$D = \{(d_j^{(1)}; \delta_j'^{(1)})_{1,m_1}\}, \tau_{i^{(1)}}(d_{ji^{(1)}}^{(1)}; \delta_{ji^{(1)}}^{(1)})_{m_1+1,q_{i^{(1)}}}\}, \cdots, \{(d_j^{(r)}; \delta_j^{(r)})_{1,m_r}\}, \tau_{i^{(r)}}(d_{ji^{(r)}}^{(r)}; \delta_{ji^{(r)}}^{(r)})_{m_r+1,q_{i^{(r)}}}\} \tag{1.11}$$

The contracted form is :

$$\aleph(z_1, \cdots, z_r) = \aleph_{U:W}^{0,n:V} \left(\begin{array}{c} z_1 \\ . \\ . \\ . \\ z_r \end{array} \left| \begin{array}{c} A : C \\ \cdots \\ B : D \end{array} \right. \right) \tag{1.12}$$

The Aleph- function , introduced by Südland [10] et al , however the notation and complete definition is presented here in the following manner in terms of the Mellin-Barnes type integral :

$$\aleph(z) = \aleph_{P_i,Q_i,c_i;r'}^{M,N} \left(z \left| \begin{array}{c} (\ a_j, A_j)_{1,n}, [c_i(a_{ji}, A_{ji})]_{n+1,p_i;r} \\ (\ b_j, B_j)_{1,m}, [c_i(b_{ji}, B_{ji})]_{m+1,q_i;r} \end{array} \right. \right) = \frac{1}{2\pi\omega} \int_L \Omega_{P_i,Q_i,c_i;r}^{M,N}(s) z^{-s} \mathrm{d}s \tag{1.13}$$

for all z different to 0 and

$$\Omega_{P_i,Q_i,c_i;r'}^{M,N}(s) = \frac{\prod_{j=1}^M \Gamma(b_j - B_j s) \prod_{j=1}^N \Gamma(1 - a_j + A_j s)}{\sum_{i=1}^r c_i \prod_{j=N+1}^{P_i} \Gamma(a_{ji} - A_{ji}s) \prod_{j=M+1}^{Q_i} \Gamma(1 - b_{ji} + B_{ji}s)} \tag{1.14}$$

With : $|arg z| < \frac{1}{2}\pi\Omega$ Where $\Omega = \sum_{j=1}^M \beta_j + \sum_{j=1}^N \alpha_j - c_i(\sum_{j=M+1}^{Q_i} \beta_{ji} + \sum_{j=N+1}^{P_i} \alpha_{ji}) > 0 \ ; i = 1, \cdots, r'$

For convergence conditions and other details of Aleph-function , see Südland et al [10], the serie representation of Aleph-function is given by Chaurasia et al [2].

$$\aleph_{P_i,Q_i,c_i;r'}^{M,N}(z) = \sum_{G=1}^M \sum_{g=0}^\infty \frac{(-)^g \Omega_{P_i,Q_i,c_i,r}^{M,N}(s)}{B_G g!} z^s \tag{1.15}$$

With $s = \eta_{G,g} = \frac{b_G + g}{B_G}, P_i < Q_i, |z| < 1$ and $\Omega_{P_i,Q_i,c_i;r}^{M,N}(s)$ is given in (1.2) \tag{1.16}

The generalized polynomials defined by Srivastava [7], is given in the following manner :

$$S_{N_1,\cdots,N_u}^{M_1,\cdots,M_u}[y_1,\cdots,y_u] = \sum_{K_1=0}^{[N_1/M_1]} \cdots \sum_{K_u=0}^{[N_u/M_u]} \frac{(-N_1)_{M_1 K_1}}{K_1!} \cdots \frac{(-N_u)_{M_u K_u}}{K_u!}$$

$$A[N_1,K_1;\cdots;N_u,K_u]y_1^{K_1}\cdots y_u^{K_u} \tag{1.17}$$

Where $M_1,\cdots,M_s$ are arbitrary positive integers and the coefficients $A[N_1,K_1;\cdots;N_u,K_u]$ are arbitrary constants, real or complex. In the present paper, we use the following notation

$$a_u = \frac{(-N_1)_{M_1 K_1}}{K_1!} \cdots \frac{(-N_u)_{M_u K_u}}{K_u!} A[N_1,K_1;\cdots;N_u,K_u] \tag{1.18}$$

The multivariable I-function is defined in term of multiple Mellin-Barnes type integral :

2. Sequence of functions

Agarwal and Chaubey [1], Salim [5] and several others have studied a general sequence of functions. In the present document we shall study the following useful series formula for a general sequence of functions.

$$R_n^{\alpha,\beta}[x;E,F,g,h;p,q;\gamma;\delta;e^{-sx^r}] = \sum_{w,v,u,t,e,k_1,k_2,} \psi(w,v,u,t,e,k_1,k_2)x^R \tag{2.1}$$

where $\displaystyle\sum_{w,v,u,t,e,k_1,k_2} = \sum_{w=0}^{\infty}\sum_{v=0}^{n}\sum_{u=0}^{v}\sum_{t=0}^{n}\sum_{c=0}^{t}\sum_{k_1=0}^{\infty}\sum_{k_2=0}^{\infty}$ (2.2)

and the infinite series on the right side (2.1) is absolutely convergent, $R = ln + qv + pt + rw + k_1 r + k_2 q$ (2.3)

and $\psi(w,v,u,t,e,k_1,k_2) = \dfrac{(-)^{t+w+k_2}(-v)_u(-t)_e(\alpha)_t l^n}{w!v!u!t!e!K_n k_1!k_2!}\dfrac{s^{w+k_1}F^{\gamma n-t}}{(1-\alpha-t)_e}(\alpha-\gamma n)_e$

$$(-\beta-\delta n)_v g^{v+k_2} h^{\delta n-v-k_2}(v-\delta n)_{k_2} E^t \left(\frac{pe+rw+\lambda+qn}{l}\right)_n \tag{2.4}$$

where K_n is a sequence of constants. This function will note $R_n^{\alpha,\beta}[x]$

By suitably specializing the parameters involving in (2.1), a general sequence of function reduced to generalized polynomials set studied by Raizada [4], a class of polynomials introduced by Fujiwara [3] and several others authors.

3. Integral representation of generalized hypergeometric function

The following generalized hypergeometric function in terms of multiple contour integrals is also required [8 ,page 39 eq .30]

$$\frac{\prod_{j=1}^{P}\Gamma(A_j)}{\prod_{j=1}^{Q}\Gamma(B_j)}\, {}_P F_Q\left[(A_P);(B_Q);-(x_1+\cdots+x_r)\right]$$

$$= \frac{1}{(2\pi\omega)^r}\int_{L_1}\cdots\int_{L_r}\frac{\prod_{j=1}^{P}\Gamma(A_j+s_1+\cdots+s_r)}{\prod_{j=1}^{Q}\Gamma(B_j+s_1+\cdots+s_r)}\Gamma(-s_1)\cdots\Gamma(-s_r)x_1^{s_1}\cdots x_r^{s_r}\mathrm{d}s_1\cdots\mathrm{d}s_r \tag{3.1}$$

where the contours are of Barnes type with indentations, if necessary, to ensure that the poles of $\Gamma(A_j + s_1 + \cdots + s_r)$ are separated from those of $\Gamma(-s_j), j = 1, \cdots, r$. The above result (1.23) can be easily established by an appeal to the calculus of residues by calculating the residues at the poles of $\Gamma(-s_j), j = 1, \cdots, r$

The equivalent form of Eulerian beta integral is :

$$\int_a^b (t-a)^{\alpha-1}(b-t)^{\beta-1}\mathrm{d}t = (b-a)^{\alpha+\beta}B(\alpha,\beta)(Re(\alpha) > 0, Re(\beta) > 0, a \neq b) \tag{3.2}$$

4. First integral

We note :

$$V_1 = V; 1, 0; \cdots ; 1, 0; 1, 0; \cdots ; 1, 0 \ ; W_1 = W; 0, 1; \cdots ; 0, 1; 0, 1; \cdots ; 0, 1 \tag{4.1}$$

$$C_1 = C; (1, 0), \cdots, (1, 0); (1, 0), \cdots, (1, 0) \ ; D_1 = D; (0, 1), \cdots, (0, 1); (0, 1), \cdots, (0, 1) \tag{4.2}$$

$$A^* = [1 + \sigma_i' - \eta_{G,g}c_i' - \sum_{j=1}^{u} K_j \xi_j^{(1,j)}; \rho_i^{(1,1)}, \cdots, \rho_i^{(1,r)}, \tau_i^{(1,1)}, \cdots, \tau_i^{(1,l)}, 1, 0, \cdots, 0]_{1,s}, \cdots,$$

$$[1 + \sigma_i^{(T)} - \eta_{G,g}c_i^{(T)} - \sum_{j=1}^{u} K_j \xi_j^{(T,j)}; \rho_i^{(T,1)}, \cdots, \rho_i^{(T,r)}, \tau_i^{(T,1)}, \cdots, \tau_i^{(T,l)}, 0, \cdots, 0, 1]_{1,s},$$

$$[1 - A_j; 0, \cdots, 0, 1, \cdots, 1, 0, \cdots, 0]_{1,P},$$

$$[1 - \alpha_i - \eta_{G,g}a_i - \sum_{j=1}^{u} K_j \alpha_i^{(j)}; \delta_i', \cdots, \delta_i^{(r)}, \mu_i', \cdots, \mu_i^{(l)}, 1, \cdots, 1, 0, \cdots, 0]_{1,s},$$

W-items   (T-W)-items

$$[1 - \beta_i - \eta_{G,g}b_i - \sum_{j=1}^{u} K_j \beta_i^{(j)}; \eta_i', \cdots, \eta_i^{(r)}, \theta_i', \cdots, \theta_i^{(l)}, 0, \cdots, 0, 1, \cdots, 1]_{1,s} \tag{4.3}$$

$$(\mu_i' + \theta_i'), \cdots, (\mu_i^{(l)} + \theta_i^{(l)}), 1, \cdots, 1]_{1,s} \tag{4.4}$$

We have the following multiple Eulerian integral and we obtain the I-function of $(r + l + T)-$variables

$$\int_{u_1}^{v_1} \cdots \int_{u_s}^{v_s} \prod_{i=1}^{s} \left[(x_i - u_i)^{\alpha_i - 1} (v_i - x_i)^{\beta_i - 1} \prod_{j=1}^{T} (u_i^{(j)} x_i + v_i^{(j)})^{\sigma_i^{(j)}} \right]$$

(K) The series occuring on the right-hand side of (4.5) are absolutely and uniformly convergent

Proof

To establish the formula (4.5), we first use series representation (1.15) and (1.17) for $\aleph_{P_i, Q_i, c_i; r}^{M,N}(.)$ and $S_{N_1, \cdots, N_u}^{M_1, \cdots, M_u}[.]$ respectively, we use contour integral representation with the help of (1.1) for the multivariable Aleph-function occuring in its left-hand side and use the contour integral representation with the help of (3.1) for the generalized hypergeometric function $_PF_Q(.)$. Changing the order of integration ans summation (which is easily seen to be justified due to the absolute convergence of the integral and the summations involved in the process) . Now we write :

$$\prod_{j=1}^{T}(U_i^{(j)}x_i + V_i^{(j)})^{K_i^{(j)}} = \prod_{j=1}^{W}(U_i^{(j)}x_i + V_i^{(j)})^{K_i^{(j)}} \prod_{j=W+1}^{T}(U_i^{(j)}x_i + V_i^{(j)})^{K_i^{(j)}}$$

where $K_i^{(j)} = \eta_i^{(j)} - \eta_{G,g}c_i^{(j)} - \sum_{l=1}^{u} K_l\xi_i^{(j,l)} - \sum_{t=1}^{r} \rho_i^{(j,t)}\zeta_t - \sum_{k=1}^{l} \tau_i^{(j,k)}\zeta_k \qquad i = 1, \cdots, s; j = 1, \cdots, T$ \hfill (4.10)

and express the factor occuring in R.H.S. Of (4.5) in terms of following Mellin-Barnes contour integral with the help of the result [8, page 18, eq.(2.6.4)]

$$\frac{1}{(2\pi\omega)^W}\int_{L_1'} \cdots \int_{L_W'} \prod_{j=1}^{W}\left[\Gamma(-\zeta_j')\Gamma(-K_i^{(j)} + \zeta_j')\prod_{j=1}^{W}(U_i^{(j)}x_i + V_i^{(j)})^{K_i^{(j)}} = \prod_{j=1}^{W}\left[\frac{(U_i^{(j)}u_i + V_i^{(j)})^{K_i'^{(j)}}}{\Gamma(-K_i^{(j)})}\right]\right.$$

$$\left.\prod_{j=1}^{W}\left[\frac{(U_i^{(j)}(x_i - u_i))}{(u_iU_i^{(j)} + V_i^{(j)})}\right]^{\zeta_j'}\right] \mathrm{d}\zeta_1' \cdots \mathrm{d}\zeta_W'$$ \hfill (4.11)

and

$$\frac{1}{(2\pi\omega)^{T-W}}\int_{L_{W+1}'} \cdots \int_{L_T'}\prod_{j=W+1}^{T}\left[\Gamma(-\zeta_j')\Gamma(-K_i^{(j)} + \zeta_j') \prod_{j=W+1}^{T}(U_i^{(j)}x_i + V_i^{(j)})^{K_i^{(j)}} = \prod_{j=W+1}^{T}\left[\frac{(U_i^{(j)}v_i + V_i^{(j)})^{K_i^{(j)}}}{\Gamma(-K_i^{(j)})}\right]\right.$$

$$\left.\prod_{j=W+1}^{T}\left[-\frac{(U_i^{(j)}(v_i - x_i))}{(v_iU_i^{(j)} + V_i^{(j)})}\right]^{\zeta_j'}\right] \mathrm{d}\zeta_{W+1}' \cdots \mathrm{d}\zeta_T'$$ \hfill (4.12)

We apply the Fubini's theorem for multiple integral. Finally evaluating the innermost **x**-integral with the help of (3.2) and reinterpreting the multiple Mellin-Barnes contour integral in terms of multivariable Aleph-function of $(r + l + T)-$ variables, we obtain the formula (4.5).

(J) The series occuring on the right-hand side of (5.5) are absolutely and uniformly convergent

Proof

To establish the formula (5.5), we first use series representation (1.15), (1.17) and (3.1) for $\aleph_{P_i,Q_i,c_i;r}^{M,N}(.)$, $S_{N_1,\cdots,N_u}^{M_1,\cdots,M_u}[.]$ and $R_n^{\alpha,\beta}[.]$ respectively and the contour integral representation with the help of (1.2) for the multivariable Aleph-function occuring in its left-hand side. Changing the order of integration ans summation (which is easily seen to be justified due to the absolute convergence of the integral and the summations involved in the process) . Now, we write:

$$\prod_{j=1}^{T}(U_i^{(j)}x_i + V_i^{(j)})^{K_i^{(j)}} = \prod_{j=1}^{W}(U_i^{(j)}x_i + V_i^{(j)})^{K_i^{(j)}} \prod_{j=W+1}^{T}(U_i^{(j)}x_i + V_i^{(j)})^{K_i^{(j)}} \qquad (5.10)$$

where $K_i^{(j)} = \eta_i^{(j)} - \eta_{G,g} c_i^{(j)} - R\theta_i^{(j)} - \sum_{l=1}^{u} L_l \xi_i^{(j,l)} - \sum_{t=1}^{r} \rho_i^{(j,t)} \zeta_t \; ; i = 1, \cdots, s ; j = 1, \cdots, T$ (5.11)

and express the factors occuring in R.H.S. Of (5.5) in terms of following Mellin-Barnes contour integral , we obtain :

$$\prod_{j=1}^{W} (U_i^{(j)} x_i + V_i^{(j)})^{K_i^{(j)}} = \prod_{j=1}^{W} \left[\frac{(U_i^{(j)} u_i + V_i^{(j)})^{K_i^{(j)}}}{\Gamma(-K_i^{(j)})} \right] \frac{1}{(2\pi\omega)^W} \int_{L_1'} \cdots \int_{L_W'} \prod_{j=1}^{W} \left[\Gamma(-\zeta_j')\Gamma(-K_i^{(j)} + \zeta_j') \right.$$

$$\left. \prod_{j=1}^{W} \left[\frac{(U_i^{(j)}(x_i - u_i))}{(u_i U_i^{(j)} + V_i^{(j)})} \right]^{\zeta_j'} \right] \mathrm{d}\zeta_1' \cdots \mathrm{d}\zeta_W' \tag{5.12}$$

and

$$\prod_{j=W+1}^{T} (U_i^{(j)} x_i + V_i^{(j)})^{K_i^{(j)}} = \prod_{j=W+1}^{T} \left[\frac{(U_i^{(j)} v_i + V_i^{(j)})^{K_i^{(j)}}}{\Gamma(-K_i^{(j)})} \right] \frac{1}{(2\pi\omega)^{T-W}} \int_{L_{W+1}'} \cdots \int_{L_T'} \prod_{j=W+1}^{T} \left[\Gamma(-\zeta_j')\Gamma(-K_i^{(j)} + \zeta_j') \right.$$

$$\left. \prod_{j=W+1}^{T} \left[\frac{(U_i^{(j)}(x_i - v_i))}{(v_i U_i^{(j)} + V_i^{(j)})} \right]^{\zeta_j'} \right] \mathrm{d}\zeta_{W+1}' \cdots \mathrm{d}\zeta_T' \tag{5.13}$$

We apply the Fubini's theorem for multiple integral. Finally evaluating the innermost **x**-integral with the help of (3.2) and reinterpreting the multiple Mellin-Barnes contour integral in terms of multivariable Aleph-function of $(r+T)-$ variables, we obtain the formula (5.5).

6. Multivariable I-function

If $\quad \tau_i, \tau_{i(1)}, \cdots, \tau_{i(r)} \quad \rightarrow 1$, the multivariable Aleph-functions reduces to multivariable I-function defined by Sharma and al [6] and we have two general multiple Eulerian integrals of multivariable I-functions.

9. Conclusion

In this paper we have evaluated two generalized multiple Eulerian integrals involving the multivariable Aleph-functions and multivariable I-function defined by Sharma et [6] with general arguments. The formulae established in this paper is very general nature. Thus, the results established in this research work would serve as a key formula from which, upon specializing the parameters, as many as desired results involving the special functions of one and several variables can be obtained.
