1. Introduction

In this paper, we evaluate two multiple Eulerian integrals involving the modified multivariable H-function defined by Prasad and Singh [5], the S generalized Gauss hypergeometric function and multivariable class of polynomials with general arguments. The modified H-function defined by Prasad and Singh [5] generalizes the multivariable H-function defined by Srivastava and Panda [11,13]. It is defined in term of multiple Mellin-Barnes type integral :

$$H(z_1,\cdots,z_r) = H^{\mathbf{m},\mathbf{n}:|R':m_1,n_1;\cdots;m_r,n_r}_{\mathbf{p},\mathbf{q}:|R:p_1,q_1;\cdots,p_r,q_r}\left(\begin{array}{c|c} \mathrm{z}_1 & (\mathrm{a}_j;\alpha_j^{(1)},\cdots,\alpha_j^{(r)})_{1,\mathbf{p}} : \\ \cdot & \\ \cdot & \\ \cdot & (\mathrm{b}_j;\beta_j^{(1)},\cdots,\beta_j^{(r)})_{1,\mathbf{q}} : \\ \mathrm{z}_r & \end{array}\right.$$

$$\left.\begin{array}{c} (\mathrm{e}_j;u'_jg'_j,\cdots,u_j^{(r)}g_j^{(r)})_{1,R'}:(c'_j;\gamma'_j)_{1,p_1},\cdots,(c_j^{(r)};\gamma_j^{(r)})_{1,p_r} \\ (\mathrm{l}_j;U'_jf'_j,\cdots,U_j^{(r)}f_j^{(r)})_{1,R}:(d'_j;\delta'_j)_{1,q_1},\cdots,(d_j^{(r)};\delta_j^{(r)})_{1,q_r} \end{array}\right) \tag{1.1}$$

$$= \frac{1}{(2\pi\omega)^r}\int_{L_1}\cdots\int_{L_r}\phi(s_1,\cdots,s_r)\prod_{i=1}^{r}\theta_i(s_i)z_i^{s_i}\mathrm{d}s_1\cdots\mathrm{d}s_r \tag{1.2}$$

where $\phi(s_1,\cdots,s_r),\theta_i(s_i), i=1,\cdots,r$ are given by :

$$\phi(s_1,\cdots,s_r) = \frac{\prod_{j=1}^{\mathbf{m}}\Gamma(b_j-\sum_{i=1}^r\beta_j^{(i)}s_i)\prod_{j=1}^{\mathbf{n}}\Gamma\left(1-a_j+\sum_{i=1}^r\alpha_j^{(i)}s_j\right)}{\prod_{j=\mathbf{n}+1}^{\mathbf{p}}\Gamma\left(a_j-\sum_{i=1}^r\alpha_j^{(i)}s_j\right)\prod_{j=\mathbf{m}+1}^{\mathbf{q}}\Gamma\left(1-b_j+\sum_{i=1}^r\beta_j^{(i)}s_j\right)}$$

$$\frac{\prod_{j=1}^{R'}\Gamma(e_j+\sum_{i=1}^{r}u_j^{(i)}g_j^{(i)}s_i)}{\prod_{j=1}^{R}\Gamma(l_j+\sum_{i=1}^{r}U_j^{(i)}f_j^{(i)}s_i)} \tag{1.3}$$

$$\phi_i(s_i)=\frac{\prod_{j=1}^{n_i}\Gamma\left(1-c_j^{(i)}+\gamma_j^{(i)}s_i\right)\prod_{j=1}^{m_i}\Gamma\left(d_j^{(i)}-\delta_j^{(i)}s_i\right)}{\prod_{j=n_i+1}^{p_i}\Gamma\left(c_j^{(i)}-\gamma_j^{(i)}s_i\right)\prod_{j=m_i+1}^{q_i}\Gamma\left(1-d_j^{(i)}+\delta_j^{(i)}s_i\right)} \tag{1.4}$$

The multiple integral (1.17) converges absolutely if

$$|argZ_k|<\frac{1}{2}U_i\pi \quad (i=1,\cdots,r) \tag{1.5}$$

$$U_i=\sum_{j=1}^{\mathbf{m}}\beta_j^{(i)}-\sum_{j=\mathbf{m}+1}^{\mathbf{q}}\beta_j^{(i)}+\sum_{j=1}^{\mathbf{n}}\alpha_j^{(i)}-\sum_{j=\mathbf{n}+1}^{\mathbf{p}}\alpha_j^{(i)}+\sum_{j=1}^{m_i}\delta_j^{(i)}-\sum_{j=1+m_i}^{q_i}\delta_j^{(i)}$$

$$+\sum_{j=1}^{n_i}\gamma_j^{(i)}-\sum_{j=n_i+1}^{p_i}\gamma_j^{(i)}+\sum_{j=1}^{R'}g_j^{(i)}-\sum_{j=1}^{R}f_j^{(i)}>0(i=1,\cdots,r) \tag{1.6}$$

Srivastava and Garg [10] introduced and defined a general class of multivariable polynomials as follows

$$S_L^{h_1,\cdots,h_u}[z_1,\cdots,z_u]=\sum_{R_1,\cdots,R_u=0}^{h_1R_1+\cdots h_uR_u\leqslant L}(-L)_{h_1R_1+\cdots+h_uR_u}B(E;R_1,\cdots,R_u)\frac{z_1^{R_1}\cdots z_u^{R_u}}{R_1!\cdots R_u!} \tag{1.7}$$

The coefficients $B(E;R_1,\cdots,R_u)$ are arbitrary constants, real or complex.

We shall note

$$B_u=\frac{(-L)_{h_1R_1+\cdots+h_uR_u}B(E;R_1,\cdots,R_u)}{R_1!\cdots R_u!} \tag{1.8}$$

2. Sequence of functions

Agarwal and Chaubey [1], Salim [7] and several others have studied a general sequence of functions. In the present document we shall study the following useful series formula for a general sequence of functions.

$$R_n^{\alpha,\beta}[x;E,F,g,h;p,q;\gamma;\delta;e^{-sx^r}]=\sum_{w,v,u,t,e,k_1,k_2,}\psi(w,v,u,t,e,k_1,k_2)x^R \tag{2.1}$$

where $$\sum_{w,v,u,t,e,k_1,k_2}=\sum_{w=0}^{\infty}\sum_{v=0}^{n}\sum_{u=0}^{v}\sum_{t=0}^{n}\sum_{c=0}^{t}\sum_{k_1=0}^{\infty}\sum_{k_2=0}^{\infty} \tag{2.2}$$

and the infinite series on the right side (2.1) is absolutely convergent, $R=ln+qv+pt+rw+k_1r+k_2q$ (2.3)

and $$\psi(w,v,u,t,e,k_1,k_2)=\frac{(-)^{t+w+k_2}(-v)_u(-t)_e(\alpha)_t l^n}{w!v!u!t!e!K_nk_1!k_2!}\frac{s^{w+k_1}F^{\gamma n-t}}{(1-\alpha-t)_e}(\alpha-\gamma n)_e$$

$$(-\beta-\delta n)_v g^{v+k_2} h^{\delta n-v-k_2}(v-\delta n)_{k_2} E^t \left(\frac{pe+rw+\lambda+qn}{l}\right)_n \tag{2.4}$$

where K_n is a sequence of constants. This function will note $R_n^{\alpha,\beta}[x]$

By suitably specializing the parameters involving in (2.1), a general sequence of function reduced to generalized polynomials set studied by Raizada [6], a class of polynomials introduced by Fujiwara [2] and several others authors.

3. S Generalized Gauss's hypergeometric function

The S generalized Gauss hypergeometric function $F_p^{(\alpha,\beta;\tau,\mu)}(a,b,c;z)$ introduced and defined by Srivastava et al [8, page 350 , Eq.(1.12)] is represented in the following manner :

$$F_p^{(\alpha,\beta;\tau,\mu)}(a,b,c;z)=\sum_{n=0}^{\infty}(a)_n\frac{B_p^{(\alpha,\beta;\tau,\mu)}(b+n,c-b)}{B(b,c-b)}\frac{z^n}{n!} \quad (|z|<1) \tag{3.1}$$

provided that $(Re(p)\geqslant 0, minRe(\alpha,\beta,\tau,\mu)>0; Re(c)>Re(b)>0)$

where the S generalized Beta function $B_p^{(\alpha,\beta;\tau,\mu)}(x,y)$ was introduced and defined by Srivastava et al [8, page 350, Eq(1.13)]

$$B_p^{(\alpha,\beta;\tau,\mu)}(x,y)=\int_1^1 t^{x-1}(1-t)^{y-1}{}_1F_1\left(\alpha;\beta;\frac{-p}{t^\tau(1-t)^\mu}\right)\mathrm{d}t \tag{3.2}$$

provided that $(Re(p)\geqslant 0, minRe(x,y,\alpha,\beta)>0; Min\{Re(\tau),Re(\mu\}>0)$

4. Integral representation of generalized hypergeometric function

The following generalized hypergeometric function in terms of multiple contour integrals is also required [12 ,page 39 eq .30]

$$\frac{\prod_{j=1}^P\Gamma(A_j)}{\prod_{j=1}^Q\Gamma(B_j)}\,{}_PF_Q\left[(A_P);(B_Q);-(x_1+\cdots+x_r)\right]$$

$$=\frac{1}{(2\pi\omega)^r}\int_{L_1}\cdots\int_{L_r}\frac{\prod_{j=1}^P\Gamma(A_j+s_1+\cdots+s_r)}{\prod_{j=1}^Q\Gamma(B_j+s_1+\cdots+s_r)}\Gamma(-s_1)\cdots\Gamma(-s_r)x_1^{s_1}\cdots x_r^{s_r}\mathrm{d}s_1\cdots\mathrm{d}s_r \tag{4.1}$$

where the contours are of Barnes type with indentations, if necessary, to ensure that the poles of $\Gamma(A_j+s_1+\cdots+s_r)$ are separated from those of $\Gamma(-s_j), j=1,\cdots,r$. The above result (1.23) can be easily established by an appeal to the calculus of residues by calculating the residues at the poles of $\Gamma(-s_j), j=1,\cdots,r$

The equivalent form of Eulerian beta integral is :

$$\int_a^b(t-a)^{\alpha-1}(b-t)^{\beta-1}\mathrm{d}t=(b-a)^{\alpha+\beta}B(\alpha,\beta)(Re(\alpha)>0,Re(\beta)>0,a\neq b) \tag{4.2}$$

5. First integral

$$Y = p_1, q_1; \cdots ; p_r, q_r; 0, 1; \cdots ; 0, 1; 0, 1; \cdots ; 0, 1 \tag{5.2}$$

$$A^* = [1 + \sigma'_i - n' c'_i - \sum_{k=1}^{u} R_k \xi_i^{(1,k)}; \rho_i^{(1,1)}, \cdots, \rho_i^{(1,r)}, \tau_i^{(1,1)}, \cdots, \tau_i^{(1,l)}, 1, 0, \cdots, 0]_{1,s}, \cdots,$$

$$(\mu'_i + \theta'_i), \cdots, (\mu_i^{(l)} + \theta_i^{(l)}), 1, \cdots, 1]_{1,s} \tag{5.6}$$

Proof

To establish the formula (5.7), we first use series representation (3.1) and (1.7) for $F_p^{(\alpha,\beta;\tau,\mu)}[.]$ and $S_L^{h_1,\cdots,h_u}[.]$ respectively, we use contour integral representation with the help of (1.1) for the modified multivariable H-function occuring in its left-hand side and use the contour integral representation with the help of (4.1) for the generalized hypergeometric function ${}_PF_Q(.)$. Changing the order of integration ans summation (which is easily seen to be justified due to the absolute convergence of the integral and the summations involved in the process) . Now we write :

$$\prod_{j=1}^{T} (U_i^{(j)} x_i + V_i^{(j)})^{K_i^{(j)}} = \prod_{j=1}^{W} (U_i^{(j)} x_i + V_i^{(j)})^{K_i^{(j)}} \prod_{j=W+1}^{T} (U_i^{(j)} x_i + V_i^{(j)})^{K_i^{(j)}}$$

where $K_i^{(j)}=\eta_i^{(j)}-n'c_i^{(j)}-\sum_{k=1}^{u}R_k\xi_i^{(j,k)}-\sum_{t=1}^{r}\rho_i^{(j,t)}\zeta_t-\sum_{k=1}^{l}\tau_i^{(j,k)}\zeta_k \qquad i=1,\cdots,s;j=1,\cdots,T$ (5.12)

and express the factor occuring in R.H.S. Of (5.13) in terms of following Mellin-Barnes contour integral with the help of the result [11, page 18, eq.(2.6.4)].

$$\prod_{j=1}^{W}(U_i^{(j)}x_i+V_i^{(j)})^{K_i^{(j)}}=\prod_{j=1}^{W}\left[\frac{(U_i^{(j)}u_i+V_i^{(j)})^{K_i'^{(j)}}}{\Gamma(-K_i^{(j)})}\right]\frac{1}{(2\pi\omega)^W}\int_{L_1'}\cdots\int_{L_W'}\prod_{j=1}^{W}\Big[\Gamma(-\zeta_j')\Gamma(-K_i^{(j)}+\zeta_j')$$

$$\prod_{j=1}^{W}\left[\frac{(U_i^{(j)}(x_i-u_i)}{(u_iU_i^{(j)}+V_i^{(j)})}\right]^{\zeta_j'}\Bigg]\mathrm{d}\zeta_1'\cdots\mathrm{d}\zeta_W' \tag{5.13}$$

and

$$\prod_{j=W+1}^{T}(U_i^{(j)}x_i+V_i^{(j)})^{K_i^{(j)}}=\prod_{j=W+1}^{T}\left[\frac{(U_i^{(j)}v_i+V_i^{(j)})^{K_i^{(j)}}}{\Gamma(-K_i^{(j)})}\right]\frac{1}{(2\pi\omega)^{T-W}}\int_{L_{W+1}'}\cdots\int_{L_T'}\prod_{j=W+1}^{T}\Big[\Gamma(-\zeta_j')\Gamma(-K_i^{(j)}+\zeta_j')$$

We apply the Fubini's theorem for multiple integral. Finally evaluating the innermost **x**-integral with the help of (4.2) and reinterpreting the multiple Mellin-Barnes contour integral in terms of modified multivariable H-function of $(r+l+T)-$variables, we obtain the formula (5.7).

Proof

To establish the formula (6.7), we first use series representation (3.1), (1.7) and (2.1) for $F_p^{(\alpha,\beta;\tau,\mu)}[.]$, $S_L^{h_1,\cdots,h_u}[.]$ and $R_n^{\alpha,\beta}[.]$ respectively and the contour integral representation with the help of (1.2) for the modified multivariable H-function defined by Prasad and Singh [5] occuring in its left-hand side. Changing the order of integration ans summation (which is easily seen to be justified due to the absolute convergence of the integral and the summations involved in the process) . Now, we write:

$$\prod_{j=1}^{T}(U_i^{(j)}x_i+V_i^{(j)})^{K_i^{(j)}}=\prod_{j=1}^{W}(U_i^{(j)}x_i+V_i^{(j)})^{K_i^{(j)}}\prod_{j=W+1}^{T}(U_i^{(j)}x_i+V_i^{(j)})^{K_i^{(j)}} \tag{6.18}$$

where $K_i^{(j)}=\eta_i^{(j)}-n'c_i^{(j)}-R\theta_i^{(j)}-\sum_{k=1}^{u}R_k\xi_i^{(j,k)}-\sum_{t=1}^{r}\rho_i^{(j,t)}\zeta_t\,;i=1,\cdots,s;j=1,\cdots,T$ (6.19)

and express the factors occuring in R.H.S. Of (6.13) in terms of following Mellin-Barnes contour integral , we obtain :

$$\prod_{j=1}^{W}(U_i^{(j)}x_i+V_i^{(j)})^{K_i^{(j)}}=\prod_{j=1}^{W}\left[\frac{(U_i^{(j)}u_i+V_i^{(j)})^{K_i^{(j)}}}{\Gamma(-K_i^{(j)})}\right]\frac{1}{(2\pi\omega)^W}\int_{L_1'}\cdots\int_{L_W'}\prod_{j=1}^{W}\Big[\Gamma(-\zeta_j')\Gamma(-K_i^{(j)}+\zeta_j')$$

$$\prod_{j=1}^{W}\left[\frac{(U_i^{(j)}(x_i-u_i)}{(u_iU_i^{(j)}+V_i^{(j)})}\right]^{\zeta_j'}\Bigg]\mathrm{d}\zeta_1'\cdots\mathrm{d}\zeta_W' \tag{6.20}$$

and

$$\prod_{j=W+1}^{T}(U_i^{(j)}x_i+V_i^{(j)})^{K_i^{(j)}}=\prod_{j=W+1}^{T}\left[\frac{(U_i^{(j)}v_i+V_i^{(j)})^{K_i^{(j)}}}{\Gamma(-K_i^{(j)})}\right]\frac{1}{(2\pi\omega)^{T-W}}\int_{L_{W+1}'}\cdots\int_{L_T'}\prod_{j=W+1}^{W}\Big[\Gamma(-\zeta_j')\Gamma(-K_i^{(j)}+\zeta_j')$$

$$\prod_{j=W+1}^{T}\left[\frac{(U_i^{(j)}(x_i-v_i)}{(v_iU_i^{(j)}+V_i^{(j)})}\right]^{\zeta_j'}\Bigg]\mathrm{d}\zeta_{W+1}'\cdots\mathrm{d}\zeta_T' \tag{6.21}$$

We apply the Fubini's theorem for multiple integral. Finally evaluating the innermost **x-**integral with the help of (3.2) and reinterpreting the multiple Mellin-Barnes contour integral in terms of modified multivariable H-function of $(r+T)-$variables, we obtain the formula (6.7)

8. Conclusion

In this paper we have evaluated two generalized multiple Eulerian integrals involving the modified multivariable H-functions defined by Prasad and Singh [5] with general arguments. The formulae established in this paper is very general nature. Thus, the results established in this research work would serve as a key formula from which, upon specializing the parameters, as many as desired results involving the special functions of one and several variables can be obtained.
